

INSTALLING PET FEEDSTER PARTS: THE MOTOR

1. Remove 8 screws from back of main body and take off back wall.
2. Pull white (-) wire and grey (+) wire from motor.
3. Remove 4 screws attaching motor to food chute.
4. Remove old motor and replace with new motor.
5. Push white and grey wires onto metal posts of new motor.
6. Connect power. You can connect AC power by plugging power adapter directly into bottom of the main body (one post has an electric plug).
7. Test motor by going into manual mode. On timer, press down on **MODE** button until **ADJ** appears on screen. Press **ADJ** button and motor should start running (press **ADJ** again to stop). Check to see that motor is turning counter clockwise. If motor is not, switch white and grey wires.
8. Attach new motor with 4 screws, reattach back wall to unit, and reattach main body to base. When reattaching main body to base, make sure they are well-connected as the electric post distributes power to unit.
